片まひの共同運動パターンに関する研究

——四肢に認められる共同運動パターン——

ABSTRACTS

Study of synergy pattern on hemiplegia
——Synergy on the limbs——

We studied about the relationship between the motor patterns of upper extremities and lower extremities in order to find the useful treatment technique of CVA hemiplegic patients.

Thirty two patients were chosen at random for investigating the motor patterns.

As a result of that, we could get the several useful motor patterns which induced the joint movement of affected side.

For example, the useful motor patterns which induces the flexion of affected upper extremity are to use the flexion of unaffected lower extremity or the flexion of affected lower extremity or the flexion of affected lower extremity or The extension of unaffected lower extremity.

Some of them in this study are already uWsed clinically, and others are new methods.

地域リハビリテーションの経験から

ABSTRACT

The experience of community rehabilitation program

The Takkyo-en Prefectural Home of Miyagi was established in 1966 as the rehabilitation facilities for the seriously crippled persons. Based upon the Disabled Persons' Welfare Law, it has been requested to serve all over the Prefecture, from the beginning. So it has been important for us to have close communication with our community.

By its nature, the doctors and P.T.'s or O.T.'s here serve concurrently at the rehabilitation clinic for the handicapped in the same district, and most of our actual activities are performed through ones at this clinic.

Our main services tied up with the clinic are brace clinic service, trareling clinic service and home-visiting.
